1 Language $\mathcal{L}$

In this section we define an imperative language $\mathcal{L}$ with memory allocation and deallocation primitives, and for simplification we only use pointers as values.

The syntax of the language $\mathcal{L}$ is as follows.

$$
\begin{aligned}
x, y, z, \ldots \text{ (variables)} \quad &\in \quad \textbf{Var} \\
s \text{ (statements)} \quad &::= \quad \textbf{skip} \mid s_1; s_2 \mid *x \leftarrow y \mid \textbf{free}(x) \\
&\quad \mid \quad \textbf{let } x = \textbf{malloc}() \textbf{ in } s \mid \textbf{let } x = \textbf{null in } s \\
&\quad \mid \quad \textbf{let } x = y \textbf{ in } s \mid \textbf{let } x = *y \textbf{ in } s \\
&\quad \mid \quad \textbf{ifnull } (*x) \textbf{ then } s_1 \textbf{ else } s_2 \mid f(\vec{x}) \\
&\quad \mid \quad \textbf{const}(*x)s \mid \textbf{endconst}(*x) \\
d \text{ (proc. defs.)} \quad &::= \quad \{f \mapsto (x_1, \ldots, x_n)s\} \\
D \text{ (definitions)} \quad &::= \quad \langle d_1 \cup \cdots \cup d_n \rangle \\
P \text{ (programs)} \quad &::= \quad \langle D, s \rangle
\end{aligned}
$$

Notation $\vec{x}$ is for a finite sequence $\{x_1, ..., x_n\}$, where we assume that each element is distinct; $[\vec{x'}/\vec{x}]s$ is for a term obtained by replacing each free occurrence of $\vec{x}$ in s with variables $\vec{x'}$.

The **Var** is a countably infinite set of *variables* and each variable is a pointer. The statement **skip** means "does nothing". The statement $s_1; s_2$ is a sequential execution of s_1 and s_2. The statement $*x \leftarrow y$ updates the content of cell which is pointed to by x with the value y. The statement **free**(x) deallocates a memory cell which is pointed to by pointer x. The statement **let** $x = e$ **in** s evaluates the expression e, binds x to the result, and executes s. The expression **malloc**$()$ allocates a new memory cell. The expression **null** evaluates to the null pointer. The expression $*y$ means dereferencing a memory cell pointed to by y. The statement **ifnull** $(*x)$**then** s_1**else** s_2 executes s_1 if $*x$ is **null** and executes s_2 otherwise. The statement $f(\vec{x})$ expresses a procedure f with arguments $\vec{x}$. The statement **const**$(*x)s$ means $(*x)$ is a constant in statement s; the statement **endconst**$(*x)$ means from this point $(*x)$ maybe not constant.

The d represents a procedure definition which maps a procedure name f to its procedure body $(\vec{x})s$; The D represents a set of procedure definitions $\langle d_1 \cup \ldots d_n \rangle$, and each definition is distinct; The pair $\langle D, s \rangle$ represents a program, where D is a set of definitions and s is a main statement; the E represents evaluation context.

1.1 Operational semantics

In this section we introduce operational semantics of language $\mathcal{L}$. We assume there is a countable infinite set $\mathcal{H}$ of *heap addresses* ranged over by l.

We use a configuration $\langle H, R, s, n, C \rangle$ to express a run-time state. Each elements in the configuration is as follows.

- H, a *heap*, is a finite mapping from $\mathcal{H}$ to $\mathcal{H} \cup \{\textbf{null}\}$;

- R, an *environment*, is a finite mapping from **Var** to $\mathcal{H} \cup \{\textbf{null}\}$;

- s is the statement that is being executed;

- n is a natural number that represents the number of memory cells available for allocation.

- C is a set of actions, which contains $\textbf{const}(*x)$, $\textbf{null}(*x)$ and $\neg\textbf{null}(*x)$.

The operational semantics of the language $\mathcal{L}$ is given by a labeled transition relation $\langle H, R, s, n, C \rangle \xrightarrow{\rho}_D \langle H', R', s', n', C' \rangle$. The label ρ is as follows.

$$\rho \text{ (label)} \quad ::= \quad \textbf{malloc} \mid \textbf{free} \mid \textbf{null}(*x) \mid \neg\textbf{null}(*x) \mid \tau$$

The ρ, an *action*, is **malloc**, **free**, or τ. The action **malloc** expresses an allocation of a memory cell; **free** expresses a deallocation of a memory cell; τ expresses the other actions. We often omit τ in $\xrightarrow{\tau}_D$. We use a metavariable σ for a finite sequence of actions $\rho_1 \ldots \rho_n$. We write $\xrightarrow{\rho_1 \ldots \rho_n}_D$ for $\xrightarrow{\rho_1}_D \xrightarrow{\rho_2}_D \ldots \xrightarrow{\rho_n}_D$. We write $\overset{\rho}{\Longrightarrow}_D$ for $\longrightarrow^*_D \xrightarrow{\rho}_D \longrightarrow^*_D$. We write $\overset{\rho_1 \ldots \rho_n}{\Longrightarrow}_D$ for $\overset{\rho_1}{\Longrightarrow}_D \ldots \overset{\rho_n}{\Longrightarrow}_D$.

Notation the $\textbf{Dom}(f)$ is a mapping from function name f to its domain; for a map f, the $f\{x \mapsto v\}$ and $f \backslash x$ are defined as follows:

$$
\begin{aligned}
f\{x \mapsto v\}(w) &= \begin{cases} v & \text{if } x = w \\ f(w) & \text{otherwise.} \end{cases} \\
(f \backslash x)(w) &= \begin{cases} \text{undefined} & \text{if } x = w \\ f(w) & \text{otherwise.} \end{cases}
\end{aligned}
$$

and $filter(C, *x)$ is defined by a pseudocode as follows:

$$
\begin{aligned}
filter(C, *x) \quad = \quad &let \ C' = C - \textbf{const}(*x) \ in \\
&if \ \textbf{const}(*x) \in \ C' \ then \ return \ C' \\
&else \ return \ C' \backslash \{\textbf{null}(*x), \neg\textbf{null}(*x)\}
\end{aligned}
$$

Figure 1 depicts the relation $\xrightarrow{\rho}_D$. Several important rules are listed as follows.

- SEM-CONSTSKIP: That a memory cell pointed to by x is no longer a constant is expressed by doing nothing.

- SEM-CONSTSEQ: That a memory cell pointed to by x should be a constant in a stamtement s is expressed by adding a statement $\textbf{endconst}(*x)$ at the end of statement s.

- SEM-FREE: Deallocation of a memory cell pointed to by x is expressed by deleting the entry for $R(x)$ from the heap. This action increments the number of available cells (i.e., n) by one (i.e., $n + 1$).

- SEM-MALLOC and SEM-OUTOFMEM: Allocation of a memory cell is expressed by adding a fresh entry to the heap. This action is allowed only if the number of available cells is positive; if the number is zero, then the configuration leads to an error state **OutOfMemory**.

- SEM-ASSIGNEXN,SEM-FREEEXN,SEM-DEREFEXN and SEM-FREEEXN : These rules express an illegal access to memory. If such action is performed, then the configuration leads to exceptional state **MemEx**. This state **MemEx** is not seen as an erroneous state in the current paper, hence a well-typed program may lead to these states. The command **free**(x) , if x is a null pointer, leads to **MemEx** in the current semantics, although it is equivalent to **skip** in the C language.

- SEM-CONSTEXN: expresses that if a constant $*x$ is changed in s it will raise **ConstEx** exception.

Our goal is to guarantee *total* memory-leak freedom and reject memory leaks. By our language $\mathcal{L}$, they are formally defined as follows:

Definition 1 (total memory-leak freedom). *A program $\langle D, s \rangle$ is* totally memory-leak free *if there is a natural number n such that it does not require more than n cells.*

Definition 2 (Memory leak). *A configuration $\langle H, R, s, n, C \rangle$ goes overflow *if there is σ such that $\langle H, R, s, n, C \rangle \overset{\sigma}{\Longrightarrow} $ **OutOfMemory**. A program $\langle D, s \rangle$ consumes at least n cells if $\langle \emptyset, \emptyset, s, n, \emptyset \rangle$ goes overflow.*

2 Type system

2.1 Types

The syntax of the types is as follows.

P	(behavioral types)	$::=$	$\mathbf{0} \mid P_1; P_2 \mid \mathbf{malloc} \mid \mathbf{free} \mid \alpha \mid \mu\alpha.P$
			$\mid (x)P \mid (*x)(P_1, P_2) \mid \mathbf{const}(*x)P \mid \mathbf{endconst}(*x)$
Γ	(variable type environment)	$::=$	$\{x_1, x_2, \ldots, x_n\}$
Ψ	(dependent function type)	$::=$	$(\vec{x})P$
Θ	(function type environment)	$::=$	$\{f_1 : \Psi_1, \ldots, f_n : \Psi_n\}$

Behavioral types ranged over by P express the abstaction of behaviors of a program. The type **0** represents the do-nothing behavior; the type $P_1; P_2$ represents the sequential execution of P_1 and P_2; The type **malloc** represents an allocation of a memory cell exactly once; the type **free** represents a deallocation; the type $\mu\alpha.P$ represents the behavior of α defined by the recursive equation $\alpha = P$; the type $(*x)(P_1, P_2)$ represents that P_1 or P_2 is obtained dependent on $*x$; the type $P_1 + P_2$ represents the choice between P_1 and P_2; the α is a type variable; the type $\mathbf{const}(*x)P$ represents that $*x$ is a constant in behavioral type P ; the type $\mathbf{endconst}(*x)$ represents $*x$ no longer be a constant from this point.

A type environments for variables ranged over by Γ is a set of variables. Since our interest is the behavior of a program, not the types of values, a variable type environment does not carry information on the types of variables.

Dependent function types ranged over by Ψ represents the behavior of a function; $\vec{x}$ is the formal arguments of the function.

Function types ranged over by Θ is a mapping from function names to dependent function types.

$$\frac{C' = filter(C, *x)}{\langle H, R, \mathbf{endconst}(*x), n, C\rangle \rightarrow_D \langle H, R, \mathbf{skip}, n, C'\rangle} \quad (\text{Sem-ConstSkip})$$

$$\langle H, R, \mathbf{const}(*x)s, n, C\rangle \rightarrow_D \langle H, R, s; \mathbf{endconst}(*x), n, C \cup \{\mathbf{const}(*x)\}\rangle \; (\text{Sem-ConstSeq})$$

$$\langle H, R, \mathbf{skip}; s, n, C\rangle \longrightarrow_D \langle H, R, s, n, C\rangle \quad (\text{Sem-Skip})$$

$$\frac{\langle H, R, s_1, n, C\rangle \xrightarrow{\rho}_D \langle H', R', s_1', n', C'\rangle}{\langle H, R, s_1; s_2, n, C\rangle \xrightarrow{\rho}_D \langle H', R', s_1'; s_2, n', C'\rangle} \quad (\text{Sem-Seq})$$

$$\frac{x' \notin \mathbf{Dom}(R)}{\langle H,\ R,\ \mathbf{let}\ x = \mathbf{null}\ \mathbf{in}\ s, n, C\rangle \longrightarrow_D \langle H,\ R\{x' \mapsto \mathbf{null}\},\ [x'/x]\,s, n, C\rangle} \quad (\text{Sem-LetNull})$$

$$\frac{x' \notin \mathbf{Dom}(R)}{\langle H,\ R,\ \mathbf{let}\ x = y\ \mathbf{in}\ s, n, C\rangle \longrightarrow_D \langle H,\ R\{x' \mapsto R(y)\},\ [x'/x]\,s, n, C\rangle} \quad (\text{Sem-LetEq})$$

$$\frac{H(R(x)) = \mathbf{null}, \mathbf{const}(*x) \notin C}{\langle H,\ R,\ \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2,\ n, C\rangle \xrightarrow{\mathbf{null}(*x)}_D \langle H,\ R,\ s_1,\ n, C\rangle} \quad (\text{Sem-IfNullT})$$

$$\frac{H(R(x)) \neq \mathbf{null}, \mathbf{const}(*x) \notin C}{\langle H,\ R,\ \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2,\ n, C\rangle \xrightarrow{\neg\mathbf{null}(*x)}_D \langle H,\ R,\ s_2,\ n, C\rangle} \quad (\text{Sem-IfNullF})$$

$$\frac{H(R(x)) = \mathbf{null}, \mathbf{const}(*x) \in C}{\langle H,\ R,\ \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2,\ n, C\rangle \xrightarrow{\mathbf{null}(*x)}_D \langle H,\ R,\ s_1,\ n, C \cup \{\mathbf{null}(*x)\}\rangle}$$
$$(\text{Sem-IfConstNullT})$$

$$\frac{H(R(x)) \neq \mathbf{null}, \mathbf{const}(*x) \in C}{\langle H,\ R,\ \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2,\ n, C\rangle \xrightarrow{\neg\mathbf{null}(*x)}_D \langle H,\ R,\ s_2,\ n, C \cup \{\neg\mathbf{null}(*x)\}\rangle}$$
$$(\text{Sem-IfConstNullF})$$

$$\frac{\forall z.R(x) = R(z) \Rightarrow \mathbf{const}(*x) \notin C}{\langle H\{R(x) \mapsto v\}, R, *x \leftarrow y, n, C\rangle \longrightarrow_D \langle H\{R(x) \mapsto R(y)\}, R, \mathbf{skip}, n, C\rangle} \quad (\text{Sem-Assign})$$

$$\frac{x' \notin \mathbf{Dom}(R) \qquad R(y) \in \mathbf{Dom}(H)}{\langle H,\ R,\ \mathbf{let}\ x = *y\ \mathbf{in}\ s, n, C\rangle \longrightarrow_D \langle H,\ R\{x' \mapsto H(R(y))\},\ [x'/x]\,s, n, C\rangle} \quad (\text{Sem-LetDeref})$$

$$\frac{R(x) \neq \mathbf{null}\ \text{and}\ R(x) \in \mathbf{Dom}(H)}{\langle H\{R(x) \mapsto v\},\ R,\ \mathbf{free}(x), n, C\rangle \xrightarrow{\mathbf{free}}_D \langle H \backslash R(x),\ R,\ \mathbf{skip}, n+1, C\rangle} \quad (\text{Sem-Free})$$

$$\frac{l \notin \mathbf{Dom}(H) \qquad n > 0 \qquad x' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)}{\langle H,\ R,\ \mathbf{let}\ x = \mathbf{malloc}()\ \mathbf{in}\ s, n, C\rangle \xrightarrow{\mathbf{malloc}}_D \langle H\{l \mapsto v\},\ R\{x' \mapsto l\},\ [x'/x]\,s, n-1, C\rangle}$$
$$(\text{Sem-Malloc})$$

$$\frac{D(f) = (\vec{y})s}{\langle H,\ R,\ f(\vec{x}), n, C\rangle \longrightarrow_D \langle H,\ R,\ [\vec{x}/\vec{y}]\,s, n, C\rangle} \qquad \frac{R(x) = \mathbf{null}\ \text{or}\ R(x) \notin \mathbf{Dom}(H)}{\langle H,\ R,\ \mathbf{free}(x), n, C\rangle \xrightarrow{\mathbf{free}}_D \mathbf{MemEx}}$$
$$(\text{Sem-Call}) \hspace{6cm} (\text{Sem-FreeExn})$$

$$\frac{R(x) = \mathbf{null}\ \text{or}\ R(x) \notin \mathbf{Dom}(H)}{\langle H,\ R,\ *x \leftarrow y, n, C\rangle \longrightarrow_D \mathbf{MemEx}} \qquad \frac{R(y) = \mathbf{null}\ \text{or}\ R(y) \notin \mathbf{Dom}(H)}{\langle H,\ R,\ \mathbf{let}\ x = *y\ \mathbf{in}\ s, n, C\rangle \longrightarrow_D \mathbf{MemEx}}$$
$$(\text{Sem-AssignExn}) \hspace{5cm} (\text{Sem-DerefExn})$$

$$\frac{\exists z.\mathbf{const}(*z) \in C\ \text{and}\ R(x) = R(z)}{\langle H\{R(x) \mapsto v\}, R, *x \leftarrow y, n, C\rangle \longrightarrow_D \mathbf{ConstEx}} \quad (\text{Sem-AssignConstExn})$$

$$\langle H,\ R,\ \mathbf{let}\ x = \mathbf{malloc}()\ \mathbf{in}\ s, 0, C\rangle \xrightarrow{\mathbf{malloc}}_D \mathbf{OutOfMemory} \quad (\text{Sem-OutOfMem})$$

Figure 1: Operational semantics of $\mathcal{L}$.

Figure 2 depicts semantics of behavioral types with dependent types, and they are given by the labeled transition system. The relation $\langle P, C \rangle \xrightarrow{\rho} \langle P', C' \rangle$ means that P can make an action ρ, and P turns into P' after it makes action ρ; C and C' record constant value environment before and after making action ρ respectively.

2.2 Typing rules

The type judgment for statements is of the form $\Theta; \Gamma \vdash s : P$, which represents that under the function type environment Θ and the variable type environment Γ, the abstracted behavioral type of statement s is P.

Before showing typing rules for statements in Figure 3, we need explain several important definitions. The first one is $OK_n(P, C)$, a predicate, where P represents the behavior of a program which consumes at most n memory cells under constant value environment C.

Definition 3 ($\sharp_\rho(\sigma)$). $\sharp_\rho(\sigma)$ *is the number of ρ in the sequence σ.*

Definition 4. $OK_n(P, C)$ *holds if $\forall P'$ and σ. if $\langle P, C \rangle \xrightarrow{\sigma} \langle P', C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$*

Intuitively, $OK_n(P, C)$ represents at very running steps, the number of memory cells a program consumed will not exceed the number of memory cells the program requires.

Definition 5 (Subtyping). $C \vdash P_1 \leq P_2$ *is the largest relation such that, for any P_1', C' and ρ, if $\langle P_1, C \rangle \xrightarrow{\rho} \langle P_1', C' \rangle$, then there exists P_2' such that $\langle P_2, C \rangle \xRightarrow{\rho} \langle P_2', ' \rangle$ and $C' \vdash P_1' \leq P_2'$. We write $P_1 \leq P_2$ if $C \vdash P_1 \leq P_2$ for any C.*

Figure 3 shows the typing rules. For example, the rule T-IfNull represents the behavior of **ifnull** ($*x$) **then** s_1 **else** s_2 is abstracted as $(*x)(P_1, P_2)$ where P_1 and P_2 are the behavior of s_1 and s_2 respectively; this conditional statement means that executing s_1 if ($*x$) is a null pointer, otherwise s_2. The typing rule T-Program represents a program requires at most n memory cells during running under the predication $OK_n(P, C)$, where P is behavioral type of statement s.

2.3 Type soundness

Theorem 2.1. *If $\vdash \langle D, s \rangle : n$ for some n, then $\langle D, s \rangle$ is totally memory-leak free.*

The proof is based on the following lemmas: preservation and lack of immediate overflow.

Definition 6. *consistency(H, R, C): for all x. (1) if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ (3) if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.*

Definition 7. *we write $\Theta \vdash \langle H, R, s, n, C \rangle : \langle P, C \rangle$, if there exists Γ such that $\Theta; \Gamma \vdash s : P$, $OK_n(P, C)$, consistency(H, R, C) and $\Gamma \subseteq \mathbf{Dom}(R)$.*

Lemma 2.2 (Preservation). *suppose that $\Theta \vdash \langle H, R, s, n, C \rangle : \langle P, C \rangle$, if $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \langle H', R', s', n', C' \rangle$ then $\exists P'$ and C' s.t. (1) $\Theta \vdash \langle H', R', s', n', C' \rangle : \langle P', C' \rangle$ and (2) $\langle P, C \rangle \xRightarrow{\rho} \langle P', C' \rangle$.*

Lemma 2.3 (Lack of immediate overflow). *If $\Theta \vdash \langle H, R, s, n, C \rangle : \langle P, C \rangle$, then $\langle H, R, s, n, C \rangle \xcancel{\xrightarrow{\mathbf{malloc}}}$ OutOfMemory.*

Figure 3: typing rules

3 Proof of Lemmas

Lemma 3.1. *If $OK_n(P, C)$ and $\langle P, C \rangle \xrightarrow{\rho} \langle P', C' \rangle$, then*

- $OK_{n-1}(P', C')$ *if* $\rho = $ **malloc**,

- $OK_{n+1}(P', C')$ *if* $\rho = $ **free**,

- $OK_n(P', C')$ *if* $\rho = $ *Otherwise*

Proof. By induction on $\langle P, C \rangle \xrightarrow{\rho} \langle P', C' \rangle$.

- Case $P = \mathbf{0}; P'$ and $\langle \mathbf{0}; P', C \rangle \to \langle P', C \rangle$

  We need to prove $OK_n(P', C)$. Assume that $OK_n(P', C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n(\mathbf{0}; P', C)$ holds, we have (1) if $\langle \mathbf{0}; P', C \rangle \to \langle P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which are in contradiction to the assumption $\sharp_m(\sigma) - \sharp_f(\sigma) > n$. Therefore, $OK_n(P', C)$ holds.

- Case $P = $ **malloc** and **malloc**, $C \rangle \xrightarrow{\textbf{malloc}} \langle 0, C \rangle$

  we need to prove $OK_{n-1}(0, C)$, which means we need to prove that for all σ and Q, if $\langle 0, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n - 1$. There is no σ and Q such that $\langle 0, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$. Therefore, $OK_{n-1}(0, C)$ holds.

- Case $P = $ **let** $x = y$ **in** P' and $\langle \mathbf{let}\ x = y\ \mathbf{in}\ P', C \rangle \to \langle [x'/x]P', C \rangle$

  [TODO]

- Case $P = $ **let** $x = *y$ **in** P' and $\langle \mathbf{let}\ x = *y\ \mathbf{in}\ P', C \rangle \to \langle [x'/x]P', F \rangle$

  Similar to the above.

- Case $P = $ **let** $x = $ **null in** P' and $\langle \mathbf{let}\ x = \mathbf{null}\ \mathbf{in}\ P', C \rangle \to \langle [x'/x]P', C \rangle$

  Similar to the above.

- Case $P = $ **free** and $\langle \mathbf{free}, C \rangle \xrightarrow{\textbf{free}} \langle \mathbf{0}, C \rangle$

  We need to prove $OK_{n+1}(\mathbf{0}, C)$, which means we need to prove (1) $\forall \sigma$ and Q if $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n + 1$. There is no Q and σ s.t. $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C \rangle$, so (1) holds. Therefore, $OK(\mathbf{0}, C)$ holds.

- Case $P = $ **endconst**$(*x)$ and $\dfrac{C' = filter(C, *x)}{\langle \mathbf{endconst}(*x), C \rangle \to \langle \mathbf{0}, C' \rangle}$

  We need to prove $OK_n(\mathbf{0}, C')$, which means we need to prove $\forall \sigma$ and Q if $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$ and (2) $OK(C')$ holds. There is no Q and σ s.t. $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C \rangle$. So $OK_n(\mathbf{0}, C')$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\mathbf{const}(*x) \notin C}{\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\mathbf{null}(*x)} \langle P_1, C \rangle}$

  We need to prove $OK_n(P_1, C)$. Assume that $OK_n(P_1, C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have (1) if $\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\mathbf{null}(*x)}$ $\langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption $\sharp_m(\sigma) - \sharp_f(\sigma) > n$. Therefore, $OK_n(P_1, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\mathbf{const}(*x) \notin C}{\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_2, C \rangle}$

  We need to prove $OK_n(P_2, C)$. Assume that $OK_n(P_2, C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have if $\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\neg \mathbf{null}(*x)}$ $\langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_2, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\mathbf{null}(*x) \in C \qquad \mathbf{const}(*x) \in C}{\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_1, C \rangle}$

  We need to prove $OK_n(P_1, C)$. Assume that $OK_n(P_1, C)$ does not hold. Then, we have (1) $\exists \sigma$ and Q s.t. $\langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have (1) if $\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_1, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\neg \mathbf{null}(*x) \in C \qquad \mathbf{const}(*x) \in C}{\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_2, C \rangle}$

  We need to prove $OK_n(P_2, C)$. Assume that $OK_n(P_2, C)$ does not hold. Then we have (1) $\exists \sigma$ and Q s.t. $\langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have (1) if $\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_2, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\mathbf{null}(*x), \neg \mathbf{null}(*x) \notin C \qquad \mathbf{const}(*x) \in C}{\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\mathbf{null}(*x)} \langle P_1, C \cup \{\mathbf{null}(*x)\} \rangle}$

  We need to prove $OK_n(P_1, C \cup \{\mathbf{null}(*x)\})$. Assume that $OK_n(P_1, C \cup \{\mathbf{null}(*x)\})$ does not hold. Then we have $\exists \sigma$ and Q s.t. $\langle P_1, C \cup \{\mathbf{null}(*x)\} \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have if $\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\mathbf{null}(*x)}$ $\langle P_1, C \cup \{\mathbf{null}(*x)\} \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$. Therefore, we get the contradiction and $OK_n(P_1, F \cup \{\mathbf{null}(*x)\})$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\mathbf{null}(*x), \neg \mathbf{null}(*x) \notin C \qquad \mathbf{const}(*x) \in C}{\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\neg \mathbf{null}(*x)} \langle P_2, C \cup \{\neg \mathbf{null}(*x)\} \rangle}$

  Similar to the above.

- Case $P = \mathbf{const}(*x)P'$ and $\langle \mathbf{const}(*x)P', C \rangle \rightarrow \langle P'; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x) \rangle$

  We need to prove $OK_n(P'; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x))$. Assume that $OK_n(P'; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x))$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P'; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x) \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n(\mathbf{const}(*x)P', C)$ holds, we have (1) if $\langle \mathbf{const}(*x)P', C \rangle \rightarrow \langle P; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x) \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P'; \mathbf{endconst}(*x), C \cup \mathbf{const}(*x))$ holds.

- Case $P = \mu\alpha.P'$ and $\langle \mu\alpha.P', C \rangle \rightarrow \langle [\mu\alpha.P'/\alpha]P', C \rangle$

  We need to prove $OK_n([\mu\alpha.P'/\alpha]P', C)$. Assume that $OK_n([\mu\alpha.P'/\alpha]P', C)$ does not hold. Then, we have (1) $\exists \sigma$ and Q s.t. $\langle [\mu\alpha.P'/\alpha]P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n(\mu\alpha.P', C)$ holds, we have (1) if $\langle \mu\alpha.P', C \rangle \rightarrow \langle [\mu\alpha.P'/\alpha]P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is a contradiction. Therefore, $OK([\mu\alpha.P'/\alpha]P', C)$ holds.

- Case $P = P_1; P_2$ and $\dfrac{\langle P_1, C \rangle \stackrel{\rho}{\Longrightarrow} \langle P_1', C' \rangle}{\langle P_1; P_2, C \rangle \stackrel{\rho}{\Longrightarrow} \langle P_1'; P_2, C' \rangle}$

  We need to prove $OK_{n'}(P_1'; P_2, C)$, where n' is determined by

  $$ n' = \begin{cases} n+1 & \rho = \textbf{free} \\ n-1 & \rho = \textbf{malloc} \\ n & \text{Otherwise.} \end{cases} $$

  Assume that $OK_{n'}(P_1'; P_2, C')$ does not hold. Then, we have (1) $\exists \sigma$, Q and C'' s.t. $\langle P_1'; P_2, C \rangle \xrightarrow{\sigma} \langle Q, C'' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n'$.

  From the definition of that $OK_n(P_1; P_2, C)$ holds, we have (1) if $\langle P_1; P_2, C \rangle \stackrel{\rho}{\Longrightarrow} \langle P_1'; P_2, C' \rangle \xrightarrow{\sigma} \langle Q, C'' \rangle$, then $\sharp_m(\rho\sigma) - \sharp_f(\rho\sigma) \leq n$.

  From (1), we get $n' + \sharp_m(\rho) - \sharp_f(\rho) < \sharp_m(\rho) + \sharp_m(\sigma) - \sharp_f(\rho) - \sharp_f(\sigma) \leq n$. For any ρ, the $n' + \sharp_m(\rho) - \sharp_f(\rho) = n$, therefore we get a contradiction. Therefore, $OK_{n'}(P_1; P_2, F')$ holds.

  $\square$

Lemma 3.2. *If $consistency(H, R, C)$ and $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \langle H', R', s', n', C' \rangle$, then $consistency(H', R', C')$.*

Proof. By induction on $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \langle H', R', s', n', C' \rangle$

- Case: $\langle H, R, \textbf{const}(*y)s, n, C \rangle \rightarrow \langle H, R, s; \textbf{endconst}(*y), n', C \cup \textbf{const}(*y) \rangle$.

  We need to prove $consistency(H, R, C \cup \textbf{const}(*y))$. Form assumption $consistency(H, R, C)$, we have (1) $\forall x$.if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x$.if $\neg\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R, C \cup \textbf{const}(*y))$, we chose z arbitrarily. (3) Assuming $\textbf{null}(*z) \in C \cup \textbf{const}(*y)$. This implies $\textbf{null}(*z) \in C$. By using (1), we have $\textbf{const}(*z) \in C$, and this implies $\textbf{const}(*z) \in C \cup \textbf{const}(*y)$. Assuming $H(R(z))$ is defined, then $H(R(z)) = null$ from (1). (4) Assuming $\neg\textbf{null}(*z) \in C \cup \textbf{const}(*y)$. This implies $\neg\textbf{null}(*z) \in C$. By using (2), we have $\textbf{const}(*z) \in C$. This implies $\textbf{const}(*z) \in C \cup \textbf{const}(*y)$. Assuming $H(R(z))$ is defined, then $H(R(z)) \neq null$ from (2).

  Therefore, $consistency(H, R, C \cup \textbf{const}(*y))$ holds.

- Case: $\langle H, R, \textbf{endconst}(*y), n, C \rangle \rightarrow \langle H, R, skip, n, C' \rangle$ where $C' = filter(C, *y)$.

  We need to prove $consistency(H, R, C')$ where $C' = filter(C, *y)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x$.if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then

$H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

To prove $consistency(H, R, C')$, we chose z arbitrarily. From the definition of function $filter(C, *y)$, we know (3) if $\mathbf{const}(*y) \in (C - \mathbf{const}(*y))$ then we have $C' = C - \mathbf{const}(*y)$, otherwise we have $C' = (C - \mathbf{const}(*y))\backslash\{\mathbf{null}(*x), \neg\mathbf{null}(*x)\}$. From (3) we have $C' \in C$. (4) Assuming $\mathbf{null}(*z) \in C'$, this implies $\mathbf{null}(*z) \in C$. From (1) we have $\mathbf{const}(*z) \in C$. Now we want to get $\mathbf{const}(*z) \in C'$. We should consider two cases: $z \neq y$ and $z = y$. If $z \neq y$ then we have $\mathbf{const}(*z) \in C'$ from (3); if $z = y$, and because $\mathbf{null}(*z) \in C'$, then we have $\mathbf{const}(*z) \in C'$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) = null$ from (1). (5) Assuming $\neg\mathbf{null}(*z) \in C'$. The similar to (4).

Therefore, $consistency(H, R, C')$ holds.

- Case: $\langle H, R, \mathbf{free}(y), n, C \rangle \xrightarrow{\mathbf{free}} \langle H\backslash R(y), R, skip, n+1, C \rangle$.

  We need to prove $consistency(H\backslash R(y), R, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H\backslash R(y), R, C)$, we chose z arbitrarily. (3) Assuming $\mathbf{null}(*z) \in C$. By using (1), we have $\mathbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) = null$ from (1). We know that y has been deallocated from H, so if $z = y$ then $H\backslash R(y)(R(z))$ is not defined, otherwise $H\backslash R(y)(R(z))$ is defined and $H\backslash R(y)(R(z)) = H(R(z)) = null$. (4) Assuming $\mathbf{null}(*z) \in C$, By using (2), we have $\mathbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) \neq null$ from (2). We know that y has been deallocated from H, so if $z = y$ then $H\backslash R(y)(R(z))$ is not defined, otherwise $H\backslash R(y)(R(z))$ is defined and $H\backslash R(y)(R(z)) = H(R(z)) \neq null$.

  Therefore, $consistency(H\backslash R(y), R, C$ holds.

- Case: $\langle H, R, \mathbf{let}\ y = \mathbf{malloc\ in}\ s, n, C \rangle \xrightarrow{\mathbf{malloc}} \langle H\{l \mapsto v\}, R\{x' \mapsto l\}, [x'/y]s, n', C \rangle$ where $x' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)$

  We need to prove $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$, we chose z arbitrarily. (3) Assuming $\mathbf{null}(*z) \in C$. From (1) we have $\mathbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) = null$ from (1). We have $x' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)$, so $z \neq x'$. Therefore we get $H\{l \mapsto v\}(R\{x' \mapsto l\}z) = H(R(z)) = null$. (4) Assuming $\neg\mathbf{null}(*z) \in C$. similar to (3).

  Therefore, $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$ holds.

- Case: $\langle H, R, skip; s, n, C \rangle \rightarrow \langle H, R, s, n', C \rangle$.

  Obviously, $consistency(H, R, C)$ holds form assumption.

- Case: $\langle H\{R(w) \mapsto v\}, R, *w \leftarrow y, n, C\rangle \to \langle H\{R(w) \mapsto R(y)\}, R, skip, n, C\rangle$ where $\forall z.R(w) = R(z) \Rightarrow \mathbf{const}(*z) \notin C$

  We need to prove $consistency(H\{R(w) \mapsto R(y)\}, R, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H\{R(w) \mapsto v\}(R(x))$ is defined then $H\{R(w) \mapsto v\}(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H\{R(w) \mapsto v\}(R(x))$ is defined then $H\{R(w) \mapsto v\}(R(x)) = null$.

  To prove $consistency(H\{R(w) \mapsto R(y)\}, R, C)$, we chose m arbitrarily. (3) Assuming $\mathbf{null}(*m) \in C$. By using (1), we have $\mathbf{const}(*m) \in C$. Then assuming $H\{R(w) \mapsto v\}(R(m))$ is defined, we have $H\{R(w) \mapsto v\}(R(m)) = null$ from (1). Because we know $\forall z.R(w) = R(z) \Rightarrow \mathbf{const}(*z) \notin C$ and $\mathbf{const}(*m) \in C$, we have $m \neq w$, then we have $H\{R(w) \mapsto R(y)\}(R(m)) = H\{R(w) \mapsto v\}(R(m)) = null$. (4) Assuming . Similar to (3).

  Therefore, $consistency(H\{R(w) \mapsto R(y)\}, R, C)$ holds.

- Case: $\langle H, R, \mathbf{let}\ z = y\ \mathbf{in}\ s, n, C\rangle \to \langle H, R\{z' \mapsto R(y)\}, [z'/z]s, n, C\rangle$ where $z' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)$

  We need to prove $consistency(H, R\{z' \mapsto R(y)\}, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R\{z' \mapsto R(y)\}, C)$, we chose m arbitrarily. (3) Assuming $\mathbf{null}(*m) \in C$. By using (1), we have $\mathbf{const}(*m) \in C$. Then assuming $H(R(m))$ is defined, we have $H(R(m)) = null$ from (1). Because we have $z' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)$, we have $m \neq z'$, then we have $H(R\{z' \mapsto R(y)\}(m)) = H(R(m)) = null$. (4) Assuming $\neg\mathbf{null}(*m) \in C$. By using (2), we have $\mathbf{const}(*m) \in C$. Then assuming $H(R(m))$ is defined, we have $H(R(m)) \neq null$ from (2). Because we have $z' \notin \mathbf{Dom}(H) \cup \mathbf{Dom}(R) \cup fv(C)$, we have $m \neq z'$, then we have $H(R\{z' \mapsto R(y)\}(m)) = H(R(m)) \neq null$.

  Therefore, $consistency(H, R\{z' \mapsto R(y)\}, C)$ holds.

- Case: $\langle H, R, \mathbf{ifnull}\ (*y)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2, n, C\rangle \xrightarrow{\mathbf{null}(*y)} \langle H, R, s_1, n, C\rangle$ where $H(R(y)) = null$ and $\mathbf{const}(*y) \notin C$

  Obviously, $consistency(H, R, C)$ holds from assumption.

- Case: $\langle H, R, \mathbf{ifnull}\ (*y)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2, n, C\rangle \xrightarrow{\neg\mathbf{null}(*y)} \langle H, R, s_2, n, C\rangle$ where $H(R(y)) \neq null$ and $\mathbf{const}(*y) \notin C$

  Obviously, $consistency(H, R, C)$ holds from assumption.

- Case: $\langle H, R, \mathbf{ifnull}\ (*y)\ \mathbf{then}\ s_1\ \mathbf{else}\ s_2, n, C\rangle \xrightarrow{\mathbf{null}(*y)} \langle H, R, s_1, n, C \cup \mathbf{null}(*y)\rangle$ where $H(R(y)) = null$ and $\mathbf{const}(*y) \in C$

  We need to prove $consistency(H, R, C \cup \mathbf{null}(*y))$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R, C \cup \mathbf{null}(*y))$, we chose z arbitrarily. (3) Assuming $\mathbf{null}(*z) \in C \cup \mathbf{null}(*y)$. This implies $\mathbf{null}(*z) \in C$. By using (1), we have $\mathbf{const}(*z) \in C$. This implies

const$(*z) \in C \cup$ **null**$(*y)$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) = null$ from (1). (4) Assuming $\neg$**null**$(*z) \in C \cup$ **null**$(*y)$. This implies $\neg$**null**$(*z) \in C$. By using (2), we have **const**$(*z) \in C$. This implies **const**$(*z) \in C \cup$ **null**$(*y)$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) \neq null$ from (2).

Therefore, $consistency(H, R, C \cup$ **null**$(*y))$ holds.

$\square$

Proof of Lemma 2.2: By induction on the derivation of $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \langle H', R', s', n', C' \rangle$.

- Case: $\langle H, R, \textbf{const}(*x)s, n, C \rangle \to \langle H, R, s; \textbf{endconst}(*x), n, C \cup \{\textbf{const}(*x)\} \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{const}(*x)s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \textbf{const}(*x)s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we get $\Theta; \Gamma \vdash s : P''$ and $\textbf{const}(*x)P'' \leq P$ for some P''. By subtyping, we have $P''; \textbf{endconst}(*x) \leq Q$ and $\langle P, C \rangle \implies \langle Q, C \cup \{\textbf{const}(*x)\} \rangle$ for some Q.

  we need to find P' and C' s.t. $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P'$, $OK_n(P', C')$, $\langle P, C \rangle \implies \langle P', C' \rangle$ and $consistency(H, R, C')$. Taking Q as P' and $C \cup \{\textbf{const}(*x)\}$ as C'. Therefore $\langle P, C \rangle \to \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold from Lemma 4.1 and Lemma 4.2. From $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P''; \textbf{endconst}(*x)$, $P''; \textbf{endconst}(*x) \leq Q$ and T-SUB, $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P'$ holds.

- Case: $\langle H, R, \textbf{endconst}(*x), n, C \rangle \to \langle H, R, \textbf{skip}, n, C' \rangle$ where $C' = filter(C, *x)$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{endconst}(*x), n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \textbf{endconst}(*x) : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we get $\Theta; \Gamma \vdash \textbf{endconst}(*x) : \textbf{endconst}(*x)$ and $\textbf{endconst}(*x) \leq P$. By subtyping, we get $0 \leq Q$ and $\langle P, C \rangle \to \langle Q, C \rangle$ for some Q.

  we need to find P' and C' s.t. $\Theta; \Gamma \vdash \textbf{skip} : P'$, $OK_n(P', C')$, $\langle P, C \rangle \implies P', C'$ and $consistency(H, R, C')$. Taking Q as P' and C as C', then $\langle P, C \rangle \to \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold from Lemma 4.1 and Lemma 4.2. From T-SKIP, T-SUB and $0 \leq Q$, then $\Theta; \Gamma \vdash \textbf{skip} : P'$ holds.

- Case: $\langle H, R, \textbf{free}(x), n, C \rangle \xrightarrow{\textbf{free}} \langle H', R, \textbf{skip}, n+1, C' \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{free}(x), n, C \rangle : \langle P, C \rangle$, we have $OK_n(P, C)$, $consistency(H, R, C)$ and $\Theta; \Gamma \vdash \textbf{free}(x) : P$. From inversion of the typing rules, we have $\Theta; \Gamma \vdash \textbf{free}(x) : \textbf{free}$ and $\textbf{free} \leq P$. By the subtyping, we have $\langle P, F \rangle \xrightarrow{\textbf{free}} \langle Q, C \rangle$ and $0 \leq Q$ for some Q.

  We need to find P' and C' such that $\langle P, C \rangle \xrightarrow{\textbf{free}} \langle P', C' \rangle$, $\Theta; \Gamma \vdash \textbf{skip} : P'$, and $OK_{n+1}(P', C')$. Take Q as P' and C as C'. Then, $\langle P, C \rangle \xrightarrow{\textbf{free}} \langle P', C' \rangle$ holds, and $OK_{n+1}(P', C')$ holds from Lemma 4.1. We also have $\Theta; \Gamma \vdash \textbf{skip} : P'$ from T-SKIP, $0 \leq Q$ and T-SUB.

- Case: $\langle H, R, \textbf{let } x = \textbf{malloc}() \textbf{ in } s, n, C \rangle \xrightarrow{\textbf{malloc}} \langle H', R', [x'/x]s, n-1, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{let } x = \textbf{malloc}() \textbf{ in } s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \textbf{let } x = \textbf{malloc}() \textbf{ in } s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. By the inversion of typing rules, we have $\Theta; \Gamma, x \vdash s : P''$ and $\textbf{malloc}; (x)P'' \leq P$ for some P''. By subtyping, we get $\langle P, C \rangle \xrightarrow{\textbf{malloc}} \langle Q, F \rangle$ and $[x'/x]P'' \leq Q$ for some Q.

13

We need to find P' and C' such that $\Theta; \Gamma, x' \vdash [x'/x]s : P'$, $\langle P, C \rangle \xrightarrow{\textbf{malloc}} \langle P', C' \rangle$, $consistency(H', R', C')$ and $OK_{n-1}(P', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \xrightarrow{\textbf{malloc}} \langle P', C' \rangle$ holds, and then $OK_{n-1}(P', C')$ and $consistency(H', R', C')$ hold by Lemma 4.1 and Lemma 4.2. From $\Theta; \Gamma, x \vdash s : P''$ and $\textbf{malloc}; (x)P'' \leq P$, we have $\Theta; \Gamma, x'' \vdash [x''/x]s : [x''/x]P''$ and $\textbf{malloc}; (x)P'' \leq P$, and then by the definition of subtyping we have $[x''/x]P'' \leq Q'$ for some Q'. Therefore, we get $\Theta; \Gamma, x'' \vdash [x''/x]s : Q'$. Take x'' as x' and Q' as P', then $\Theta; \Gamma, x' \vdash [x'/x]s : P'$ holds.

- Case: $\langle H, R, \textbf{skip}; s, n, C \rangle \rightarrow \langle H, R, s, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{skip}; s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \textbf{skip}; s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of the typing rules, we get $\Theta; \Gamma \vdash s : P''$ and $0; P'' \leq P$. From the definition of subtyping, we have $\langle P, C \rangle \implies \langle Q, C \rangle$ and $P'' \leq Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma \vdash s : P'$ and $\langle P, C \rangle \rightarrow \langle P', C' \rangle$ and $OK_n(P', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \implies \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold. We also have $\Theta; \Gamma \vdash s : P'$ from T-SUB, $\Gamma \vdash s : P''$ and $P'' \leq Q$.

- Case: $\langle H, R, *x \leftarrow y, n, C \rangle \rightarrow \langle H', R, \textbf{skip}, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, *x \leftarrow y, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash *x \leftarrow y : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $0 \leq P$.

  We need to find P' and C' such that $\Theta; \Gamma \vdash \textbf{skip} : P'$, $\langle P, C \rangle \implies \langle P', C' \rangle$ and $OK_n(P', C')$. Take P as P' and C as C'. Then $\langle P, C \rangle \implies \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H', R, C')$ hold from Lemma 4.1 and Lemma 4.2. We also have $\Theta; \Gamma \vdash \textbf{skip} : P'$ from T-SKIP, $0 \leq P$ and T-SUB.

- Case: $\langle H, R, \textbf{let } x = y \textbf{ in } s, n, C \rangle \rightarrow \langle H, R', [x'/x]s, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{let } x = y \textbf{ in } s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma, y \vdash \textbf{let } x = y \textbf{ in } s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta; \Gamma, x, y \vdash s : P''$ and $\textbf{let } x = y \textbf{ in } P'' \leq P$ for some P''. By subtyping, we have $\langle P, C \rangle \rightarrow \langle Q, C \rangle$ and $[x'/x]P'' \leq Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma, x', y \vdash [x'/x]s : P'$, $\langle P, C \rangle \rightarrow \langle P', C' \rangle$, $OK_n(P', C')$ and $consistency(H, R', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \implies \langle P', C' \rangle$ and $OK_n(P', C')$ hold. From $\Theta; \Gamma, x, y \vdash s : P''$ and $\textbf{let } x = y \textbf{ in } P'' \leq P$, we have $\Theta; \Gamma, x'', y \vdash [x''/x]s : [x''/x]P''$ and $\textbf{let } x'' = y \textbf{ in } [x''/x]P'' \leq P$, and then by subtyping we have $[x''/x]P'' \leq Q'$ for some Q'. Therefore, we have $\Theta; \Gamma, x'', y \vdash [x''/x]s : Q'$. Take x'' as x' and Q' as P', then $\Theta; \Gamma, x', y \vdash [x'/x]s : P'$ holds.

- Case: $\langle H, R, \textbf{let } x = \textbf{null in } s, n \rangle \rightarrow \langle H, R', [x'/x]s, n \rangle$
  Similar to the above.

- Case: $\langle H, R, \textbf{let } x = *y \textbf{ in } s, n \rangle \rightarrow \langle H, R', [x'/x]s, n \rangle$
  Similar to the above.

- Case: $\langle H, R, \textbf{ifnull } (*x) \textbf{ then } s_1 \textbf{ else } s_2, n, C \rangle \xrightarrow{\textbf{null}(*x)} \langle H, R, s_1, n, C \rangle$ if $H(R(x)) = \textbf{null}$ and $\textbf{const}(*x) \notin C$

14

From assumption $\Theta;\Gamma \vdash \langle H, R, \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2, n, C\rangle : \langle P, C\rangle$, we have $\Theta;\Gamma \vdash \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta;\Gamma \vdash s_1 : P_1$, $\Theta;\Gamma \vdash s_2 : P_2$ and $(*x)(P_1, P_2) \leq P$. According to the rule Tr-NotConst1 and $\textbf{const}(*x) \notin C$, we have $\langle (*x)(P_1, P_2)\rangle \xrightarrow{\textbf{null}(*x)} \langle P_1, C\rangle$, and then by definition of subtyping, we get $\langle P, C\rangle \xRightarrow{\textbf{null}(*x)} \langle Q, C\rangle$ and $P_1 \leq Q$ for some Q.

We need to find P' and C' such that $\Theta;\Gamma \vdash s_1 : P'$, $\langle P, C\rangle \xRightarrow{\textbf{null}(*x)} \langle P', C'\rangle$ and $OK_n(P', C')$. Take Q as P' and C as C'. Then $\langle P, C\rangle \xRightarrow{\textbf{null}(*x)} \langle P', C'\rangle$ and $OK_n(P', C')$ hold. We also have $\Theta;\Gamma \vdash s_1 : P'$ from T-Sub, $\Theta;\Gamma \vdash s_1 : P_1$ and $P_1 \leq Q$.

- Case: $\langle H, R, \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2, n, C\rangle \xrightarrow{\neg\textbf{null}(*x)} \langle H, R, s_1, n, C\rangle$ if $H(R(x)) \neq \textbf{null}$ and $\textbf{const}(*x) \notin C$

  Similar to the above.

- Case: $\langle H, R, \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2, n, C\rangle \xrightarrow{\textbf{null}(*x)} \langle H, R, s_1, n, C'\rangle$ if $H(R(x)) = \textbf{null}$, $\textbf{const}(*x) \in C$ and $C' = C \cup \{\textbf{null}(*x)\}$

  From assumption $\Theta;\Gamma \vdash \langle H, R, \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2, n, C\rangle : \langle P, C\rangle$, we have $\Theta;\Gamma \vdash \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta;\Gamma \vdash s_1 : P_1$, $\Theta;\Gamma \vdash s_2 : P_2$ and $(*x)(P_1, P_2) \leq P$. According to rule Tr-NNullNotIn1, $\textbf{const}(*x) \in C$ and $C' = C \cup \textbf{null}(*x)$, we have $\langle (*x)(P_1, P_2)\rangle \xrightarrow{\textbf{null}(*x)} \langle P_1, C \cup \textbf{null}(*x)\rangle$, and then by the definition of subtyping, we get $\langle P, C\rangle \xRightarrow{\textbf{null}(*x)} \langle Q, C \cup \{\textbf{null}(*x)\}\rangle$ and $P_1 \leq Q$ for some Q.

  We need to find P' and C' such that $\Theta;\Gamma \vdash s_1 : P'$, $\langle P, C\rangle \xRightarrow{\textbf{null}(*x)} \langle P', C'\rangle$, $OK_n(P', C')$ and $consistency(H, R, C')$. Take Q as P' and $C \cup \{\textbf{null}(*x)\}$ as C'. Then $\langle P, C\rangle \xrightarrow{\textbf{null}(*x)} \langle P', c'\rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold by Lemma 4.1 and Lemma 4.2. We also have $\Theta;\Gamma \vdash s_1 : P'$ from T-Sub, $\Theta;\Gamma \vdash s_1 : P_1$ and $P_1 \leq Q$.

- Case: $\langle H, R, \textbf{ifnull}\ (*x)\ \textbf{then}\ s_1\ \textbf{else}\ \ s_2, n, C\rangle \xrightarrow{\neg\textbf{null}(*x)} \langle H, R, s_2, n, C'\rangle$ if $H(R(x)) \neq \textbf{null}$, $\textbf{const}(*x) \in C$ and $C' = C \cup \{\neg\textbf{null}(*x)\}$

  Similar to the above proof.

- Case: $\langle H, R, s_1; s_2, n, C\rangle \rightarrow \langle H', R', s_1'; s_2, n', C'\rangle$

  From the assumption $\Theta;\Gamma \vdash \langle H, R, s_1; s_2, n, C\rangle : \langle P, C\rangle$, we have $\Theta;\Gamma \vdash s_1; s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. By inversion of typing rules, we have $\Theta;\Gamma \vdash s_1 : P_1$, $\Theta;\Gamma \vdash s_2 : P_2$ and $P_1; P_2 \leq P$ for some P_1 and P_2.

  By IH on $\langle H, R, s_1, n, C\rangle$ with derivation $\langle H, R, s_1, n, C\rangle \xrightarrow{\rho} \langle H', R', s_1', n', C'\rangle$, we have $\exists P_1', C_1'$ s.t. $\Theta;\Gamma \vdash \langle H', R', s_1', n', C'\rangle : \langle P_1', C_1'\rangle$ and $\langle P_1, C\rangle \xrightarrow{\rho} \langle P_1', C_1'\rangle$.

  By subtyping we have $\langle P, C\rangle \xrightarrow{\rho} \langle Q, C_1'\rangle$ and $P_1'; P_2 \leq Q$ for some Q.

  We need to find P' and C' s.t. $\langle P, C\rangle \xrightarrow{\rho} \langle P', C'\rangle$, $OK_n(P', C')$ and $\Theta;\Gamma \vdash s_1'; s_2 : P'\rangle$. Take Q as P' and C_1' as C', $\langle P, C\rangle \xrightarrow{\rho} \langle P', C'\rangle$ and $OK_n(P', C')$ hold. By T-Sub, $\Theta;\Gamma \vdash s_1'; s_2 : P_1'; P_2$ and $P_1'; P_2 \leq Q$, we have $\Theta;\Gamma \vdash s_1'; s_2 : P'$ holds.

$\square$

We write $\langle H, R, s, n, C \rangle \xrightarrow{\rho}$ if there is a transition $\xrightarrow{\rho}$ from $\langle H, R, s, n, C \rangle$.

Lemma 3.3. *If* $\Theta \vdash \langle H, R, s, n, C \rangle : \langle P, C \rangle$ *and* $\langle H, R, s, n, C \rangle \xRightarrow{\rho}$ *and* $\rho \in \{\textbf{malloc}, \textbf{free}, \textbf{null}(*x), \neg\textbf{null}(*x)\}$, *then there exists* P' *and* C' *such that* $\langle P, C \rangle \xRightarrow{\rho} \langle P', C' \rangle$.

Proof. Induction on the derivation of $\Theta; \Gamma \vdash \langle H, R, s, n, C \rangle : \langle P, C \rangle$. $\square$

Proof of Lemma 2.3:

By contradiction. Assume $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \textbf{OutOfMemory}$. Then, n is 0 and $\rho = \textbf{malloc}$ from SEM-OUTOFMEM. From the assumption we have $\Theta; \Gamma \vdash s : P$ and $OK_0(P, C)$. From Lemma 4.3, there exists P' and C' such that $\langle P, C \rangle \xRightarrow{\textbf{malloc}} \langle P', C' \rangle$. However, this contradicts $OK_0(P, C)$.

$\square$

Proof of Theorem 2.1:

We have $\Theta; \emptyset \vdash s : P, \vdash D : \Theta$, $OK_n(P, C)$ and *consistency*(H, R, C).

Suppose that there exists σ such that $\langle \emptyset, \emptyset, s, n, C \rangle \xrightarrow{\sigma} \langle H', R', s', n', C' \rangle \xrightarrow{\rho} \textbf{OutOfMemory}$. Then, $n' = 0$ and $\rho = \textbf{malloc}$. From Lemma 2.2, there exists P' and C' such that $\Theta; \Gamma' \vdash s' : P'$, $\langle P, C \rangle \xRightarrow{\sigma} \langle P', C' \rangle$, and $OK_0(P', C')$; hence $\langle H', R', s', 0 \rangle \xrightarrow{\textbf{malloc}}$. However, this contradicts Lemma 2.3.

$\square$

=======

4   Proof of Lemmas

Lemma 4.1. *If* $OK_n(P, C)$ *and* $\langle P, C \rangle \xrightarrow{\rho} \langle P', C' \rangle$, *then*

- $OK_{n-1}(P', C')$ *if* $\rho = \textbf{malloc}$,

- $OK_{n+1}(P', C')$ *if* $\rho = \textbf{free}$,

- $OK_n(P', C')$ *if* $\rho = Otherwise$

Proof. By induction on $\langle P, C \rangle \xrightarrow{\rho} \langle P', C' \rangle$.

- Case $P = \mathbf{0}; P'$ and $\langle \mathbf{0}; P', C \rangle \to \langle P', C \rangle$

  We need to prove $OK_n(P', C)$. Assume that $OK_n(P', C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n(\mathbf{0}; P', C)$ holds, we have (1) if $\langle \mathbf{0}; P', C \rangle \to \langle P', C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \le n$, which are in contradiction to the assumption $\sharp_m(\sigma) - \sharp_f(\sigma) > n$. Therefore, $OK_n(P', C)$ holds.

- Case $P = \textbf{malloc}$ and $\textbf{malloc}, C \rangle \xrightarrow{\textbf{malloc}} \langle 0, C \rangle$

  we need to prove $OK_{n-1}(0, C)$, which means we need to prove that for all σ and Q, if $\langle 0, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ then $\sharp_m(\sigma) - \sharp_f(\sigma) \le n - 1$. There is no σ and Q such that $\langle 0, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$. Therefore, $OK_{n-1}(0, C)$ holds.

- Case $P = \textbf{let } x = y \textbf{ in } P'$ and $\langle \textbf{let } x = y \textbf{ in } P', C \rangle \rightarrow \langle [x'/x]P', C \rangle$

  [TODO]

- Case $P = \textbf{let } x = *y \textbf{ in } P'$ and $\langle \textbf{let } x = *y \textbf{ in } P', C \rangle \rightarrow \langle [x'/x]P', F \rangle$

  Similar to the above.

- Case $P = \textbf{let } x = \textbf{null in } P'$ and $\langle \textbf{let } x = \textbf{null in } P', C \rangle \rightarrow \langle [x'/x]P', C \rangle$

  Similar to the above.

- Case $P = \textbf{free}$ and $\langle \textbf{free}, C \rangle \xrightarrow{\textbf{free}} \langle \mathbf{0}, C \rangle$

  We need to prove $OK_{n+1}(\mathbf{0}, C)$, which means we need to prove (1) $\forall \sigma$ and Q if $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n+1$. There is no Q and σ s.t. $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C \rangle$, so (1) holds. Therefore, $OK(\mathbf{0}, C)$ holds.

- Case $P = \textbf{endconst}(*x)$ and $\dfrac{C' = filter(C, *x)}{\langle \textbf{endconst}(*x), C \rangle \rightarrow \langle \mathbf{0}, C' \rangle}$

  We need to prove $OK_n(\mathbf{0}, C')$, which means we need to prove $\forall \sigma$ and Q if $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$ and (2) $OK(C')$ holds. There is no Q and σ s.t. $\langle \mathbf{0}, C \rangle \xrightarrow{\sigma} \langle Q, C \rangle$. So $OK_n(\mathbf{0}, C')$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\textbf{const}(*x) \notin C}{\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\textbf{null}(*x)} \langle P_1, C \rangle}$

  We need to prove $OK_n(P_1, C)$. Assume that $OK_n(P_1, C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have (1) if $\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\textbf{null}(*x)} \langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption $\sharp_m(\sigma) - \sharp_f(\sigma) > n$. Therefore, $OK_n(P_1, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\textbf{const}(*x) \notin C}{\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_2, C \rangle}$

  We need to prove $OK_n(P_2, C)$. Assume that $OK_n(P_2, C)$ does not hold. Then, we have $\exists \sigma$ and Q s.t. $\langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have if $\langle (*x)(P_1, P_2), C \rangle \xrightarrow{\neg\textbf{null}(*x)} \langle P_2, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_2, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\textbf{null}(*x) \in C \qquad \textbf{const}(*x) \in C}{\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_1, C \rangle}$

  We need to prove $OK_n(P_1, C)$. Assume that $OK_n(P_1, C)$ does not hold. Then, we have (1) $\exists \sigma$ and Q s.t. $\langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$ and $\sharp_m(\sigma) - \sharp_f(\sigma) > n$.

  From the definition of that $OK_n((*x)(P_1, P_2), C)$ holds, we have (1) if $\langle (*x)(P_1, P_2), C \rangle \rightarrow \langle P_1, C \rangle \xrightarrow{\sigma} \langle Q, C' \rangle$, then $\sharp_m(\sigma) - \sharp_f(\sigma) \leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_1, C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\neg\textbf{null}(*x)\in C \qquad \textbf{const}(*x)\in C}{\langle(*x)(P_1,P_2),C\rangle\rightarrow\langle P_2,C\rangle}$

  We need to prove $OK_n(P_2,C)$. Assume that $OK_n(P_2,C)$ does not hold. Then we have (1) $\exists\sigma$ and Q s.t. $\langle P_2,C\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$ and $\sharp_m(\sigma)-\sharp_f(\sigma)>n$.

  From the definition of that $OK_n((*x)(P_1,P_2),C)$ holds, we have (1) if $\langle(*x)(P_1,P_2),C\rangle\rightarrow\langle P_2,C\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$, then $\sharp_m(\sigma)-\sharp_f(\sigma)\leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P_2,C)$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\textbf{null}(*x),\neg\textbf{null}(*x)\notin C \qquad \textbf{const}(*x)\in C}{\langle(*x)(P_1,P_2),C\rangle\xrightarrow{\textbf{null}(*x)}\langle P_1,C\cup\{\textbf{null}(*x)\}\rangle}$

  We need to prove $OK_n(P_1,C\cup\{\textbf{null}(*x)\})$. Assume that $OK_n(P_1,C\cup\{\textbf{null}(*x)\})$ does not hold. Then we have $\exists\sigma$ and Q s.t. $\langle P_1,C\cup\{\textbf{null}(*x)\}\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$ and $\sharp_m(\sigma)-\sharp_f(\sigma)>n$.

  From the definition of that $OK_n((*x)(P_1,P_2),C)$ holds, we have if $\langle(*x)(P_1,P_2),C\rangle\xrightarrow{\textbf{null}(*x)}\langle P_1,C\cup\{\textbf{null}(*x)\}\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$, then $\sharp_m(\sigma)-\sharp_f(\sigma)\leq n$. Therefore, we get the contradiction and $OK_n(P_1,F\cup\{\textbf{null}(*x)\})$ holds.

- Case $P = (*x)(P_1, P_2)$ and $\dfrac{\textbf{null}(*x),\neg\textbf{null}(*x)\notin C \qquad \textbf{const}(*x)\in C}{\langle(*x)(P_1,P_2),C\rangle\xrightarrow{\neg\textbf{null}(*x)}\langle P_2,C\cup\{\neg\textbf{null}(*x)\}\rangle}$

  Similar to the above.

- Case $P = \textbf{const}(*x)P'$ and $\langle\textbf{const}(*x)P',C\rangle\rightarrow\langle P';\textbf{endconst}(*x),C\cup\textbf{const}(*x)\rangle$

  We need to prove $OK_n(P';\textbf{endconst}(*x),C\cup\textbf{const}(*x))$. Assume that $OK_n(P';\textbf{endconst}(*x),C\cup\textbf{const}(*x))$ does not hold. Then, we have $\exists\sigma$ and Q s.t. $\langle P';\textbf{endconst}(*x),C\cup\textbf{const}(*x)\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$ and $\sharp_m(\sigma)-\sharp_f(\sigma)>n$.

  From the definition of that $OK_n(\textbf{const}(*x)P',C)$ holds, we have (1) if $\langle\textbf{const}(*x)P',C\rangle\rightarrow\langle P;\textbf{endconst}(*x),C\cup\textbf{const}(*x)\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$, then $\sharp_m(\sigma)-\sharp_f(\sigma)\leq n$, which is in contradiction to the assumption. Therefore, $OK_n(P';\textbf{endconst}(*x),C\cup\textbf{const}(*x))$ holds.

- Case $P = \mu\alpha.P'$ and $\langle\mu\alpha.P',C\rangle\rightarrow\langle[\mu\alpha.P'/\alpha]P',C\rangle$

  We need to prove $OK_n([\mu\alpha.P'/\alpha]P',C)$. Assume that $OK_n([\mu\alpha.P'/\alpha]P',C)$ does not hold. Then, we have (1) $\exists\sigma$ and Q s.t. $\langle[\mu\alpha.P'/\alpha]P',C\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$ and $\sharp_m(\sigma)-\sharp_f(\sigma)>n$.

  From the definition of that $OK_n(\mu\alpha.P',C)$ holds, we have (1) if $\langle\mu\alpha.P',C\rangle\rightarrow\langle[\mu\alpha.P'/\alpha]P',C\rangle\xrightarrow{\sigma}\langle Q,C'\rangle$, then $\sharp_m(\sigma)-\sharp_f(\sigma)\leq n$, which is a contradiction. Therefore, $OK([\mu\alpha.P'/\alpha]P',C)$ holds.

- Case $P = P_1; P_2$ and $\dfrac{\langle P_1,C\rangle\overset{\rho}{\Longrightarrow}\langle P_1',C'\rangle}{\langle P_1;P_2,C\rangle\overset{\rho}{\Longrightarrow}\langle P_1';P_2,C'\rangle}$

  We need to prove $OK_{n'}(P_1';P_2,C)$, where n' is determined by

  $$n' = \begin{cases} n+1 & \rho=\textbf{free} \\ n-1 & \rho=\textbf{malloc} \\ n & \text{Otherwise.} \end{cases}$$

  Assume that $OK_{n'}(P_1';P_2,C')$ does not hold. Then, we have (1) $\exists\sigma$, Q and C'' s.t. $\langle P_1';P_2,C\rangle\xrightarrow{\sigma}\langle Q,C''\rangle$ and $\sharp_m(\sigma)-\sharp_f(\sigma)>n'$.

From the definition of that $OK_n(P_1; P_2, C)$ holds, we have (1) if $\langle P_1; P_2, C \rangle \stackrel{\rho}{\Longrightarrow} \langle P_1'; P_2, C'' \rangle \stackrel{\sigma}{\longrightarrow} \langle Q, C'' \rangle$, then $\sharp_m(\rho\sigma) - \sharp_f(\rho\sigma) \leq n$.

From (1), we get $n' + \sharp_m(\rho) - \sharp_f(\rho) < \sharp_m(\rho) + \sharp_m(\sigma) - \sharp_f(\rho) - \sharp_f(\sigma) \leq n$. For any ρ, the $n' + \sharp_m(\rho) - \sharp_f(\rho) = n$, therefore we get a contradiction. Therefore, $OK_{n'}(P_1; P_2, F')$ holds.

$\square$

Lemma 4.2. *If $consistency(H, R, C)$ and $\langle H, R, s, n, C \rangle \stackrel{\rho}{\longrightarrow} \langle H', R', s', n', C' \rangle$, then $consistency(H', R', C')$.*

Proof. By induction on $\langle H, R, s, n, C \rangle \stackrel{\rho}{\longrightarrow} \langle H', R', s', n', C' \rangle$

- Case: $\langle H, R, \mathbf{const}(*y)s, n, C \rangle \rightarrow \langle H, R, s; \mathbf{endconst}(*y), n', C \cup \mathbf{const}(*y) \rangle$.

  We need to prove $consistency(H, R, C \cup \mathbf{const}(*y))$. Form assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R, C \cup \mathbf{const}(*y))$, we chose z arbitrarily. (3) Assuming $\mathbf{null}(*z) \in C \cup \mathbf{const}(*y)$. This implies $\mathbf{null}(*z) \in C$. By using (1), we have $\mathbf{const}(*z) \in C$, and this implies $\mathbf{const}(*z) \in C \cup \mathbf{const}(*y)$. Assuming $H(R(z))$ is defined, then $H(R(z)) = null$ from (1). (4) Assuming $\neg\mathbf{null}(*z) \in C \cup \mathbf{const}(*y)$. This implies $\neg\mathbf{null}(*z) \in C$. By using (2), we have $\mathbf{const}(*z) \in C$. This implies $\mathbf{const}(*z) \in C \cup \mathbf{const}(*y)$. Assuming $H(R(z))$ is defined, then $H(R(z)) \neq null$ from (2).

  Therefore, $consistency(H, R, C \cup \mathbf{const}(*y))$ holds.

- Case: $\langle H, R, \mathbf{endconst}(*y), n, C \rangle \rightarrow \langle H, R, skip, n, C' \rangle$ where $C' = filter(C, *y)$.

  We need to prove $consistency(H, R, C')$ where $C' = filter(C, *y)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R, C')$, we chose z arbitrarily. From the definition of function $filter(C, *y)$, we know (3) if $\mathbf{const}(*y) \in (C - \mathbf{const}(*y))$ then we have $C' = C - \mathbf{const}(*y)$, otherwise we have $C' = (C - \mathbf{const}(*y))\backslash\{\mathbf{null}(*x), \neg\mathbf{null}(*x)\}$. From (3) we have $C' \in C$. (4) Assuming $\mathbf{null}(*z) \in C'$, this implies $\mathbf{null}(*z) \in C$. From (1) we have $\mathbf{const}(*z) \in C$. Now we want to get $\mathbf{const}(*z) \in C'$. We should consider two cases: $z \neq y$ and $z = y$. If $z \neq y$ then we have $\mathbf{const}(*z) \in C'$ from (3); if $z = y$, and because $\mathbf{null}(*z) \in C'$, then we have $\mathbf{const}(*z) \in C'$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) = null$ from (1). (5) Assuming $\neg\mathbf{null}(*z) \in C'$. The similar to (4).

  Therefore, $consistency(H, R, C')$ holds.

- Case: $\langle H, R, \mathbf{free}(y), n, C \rangle \stackrel{\mathbf{free}}{\longrightarrow} \langle H\backslash R(y), R, skip, n+1, C \rangle$.

  We need to prove $consistency(H\backslash R(y), R, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\mathbf{null}(*x) \in C$, then $\mathbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

To prove $consistency(H\backslash R(y), R, C$, we chose z arbitrarily. (3) Assuming $\textbf{null}(*z) \in C$. By using (1), we have $\textbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) = null$ from (1). We know that y has been deallocated from H, so if $z = y$ then $H\backslash R(y)(R(z))$ is not defined, otherwise $H\backslash R(y)(R(z))$ is defined and $H\backslash R(y)(R(z)) = H(R(z)) = null$. (4) Assuming $\textbf{null}(*z) \in C$, By using (2), we have $\textbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) \neq null$ from (2). We know that y has been deallocated from H, so if $z = y$ then $H\backslash R(y)(R(z))$ is not defined, otherwise $H\backslash R(y)(R(z))$ is defined and $H\backslash R(y)(R(z)) = H(R(z)) \neq null$.

Therefore, $consistency(H\backslash R(y), R, C$ holds.

- Case: $\langle H, R, \textbf{let } y = \textbf{malloc in } s, n, C \rangle \xrightarrow{\textbf{malloc}} \langle H\{l \mapsto v\}, R\{x' \mapsto l\}, [x'/y]s, n', C\rangle$ where $x' \notin \textbf{Dom}(H) \cup \textbf{Dom}(R) \cup fv(C)$

  We need to prove $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x$.if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x$.if $\neg\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$, we chose z arbitrarily. (3) Assuming $\textbf{null}(*z) \in C$. From (1) we have $\textbf{const}(*z) \in C$. Assuming $H(R(z))$ is defined, we have $H(R(z)) = null$ from (1). We have $x' \notin \textbf{Dom}(H) \cup \textbf{Dom}(R) \cup fv(C)$, so $z \neq x'$. Therefore we get $H\{l \mapsto v\}(R\{x' \mapsto l\}z) = H(R(z)) = null$. (4) Assuming $\neg\textbf{null}(*z) \in C$. similar to (3).

  Therefore, $consistency(H\{l \mapsto v\}, R\{x' \mapsto l\}, C)$ holds.

- Case: $\langle H, R, skip; s, n, C\rangle \rightarrow \langle H, R, s, n', C\rangle$.

  Obviously, $consistency(H, R, C)$ holds form assumption.

- Case: $\langle H\{R(w) \mapsto v\}, R, *w \leftarrow y, n, C\rangle \rightarrow \langle H\{R(w) \mapsto R(y)\}, R, skip, n, C\rangle$ where $\forall z.R(w) = R(z) \Rightarrow \textbf{const}(*z) \notin C$

  We need to prove $consistency(H\{R(w) \mapsto R(y)\}, R, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x$.if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H\{R(w) \mapsto v\}(R(x))$ is defined then $H\{R(w) \mapsto v\}(R(x)) = null$ and (2) $\forall x$.if $\neg\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H\{R(w) \mapsto v\}(R(x))$ is defined then $H\{R(w) \mapsto v\}(R(x)) = null$.

  To prove $consistency(H\{R(w) \mapsto R(y)\}, R, C)$, we chose m arbitrarily. (3) Assuming $\textbf{null}(*m) \in C$. By using (1), we have $\textbf{const}(*m) \in C$. Then assuming $H\{R(w) \mapsto v\}(R(m))$ is defined, we have $H\{R(w) \mapsto v\}(R(m)) = null$ from (1). Because we know $\forall z.R(w) = R(z) \Rightarrow \textbf{const}(*z) \notin C$ and $\textbf{const}(*m) \in C$, we have $m \neq w$, then we have $H\{R(w) \mapsto R(y)\}(R(m)) = H\{R(w) \mapsto v\}(R(m)) = null$. (4) Assuming . Similar to (3).

  Therefore, $consistency(H\{R(w) \mapsto R(y)\}, R, C)$ holds.

- Case: $\langle H, R, \textbf{let } z = y \textbf{ in } s, n, C\rangle \rightarrow \langle H, R\{z' \mapsto R(y)\}, [z'/z]s, n, C\rangle$ where $z' \notin \textbf{Dom}(H) \cup \textbf{Dom}(R) \cup fv(C)$

  We need to prove $consistency(H, R\{z' \mapsto R(y)\}, C)$. From assumption $consistency(H, R, C)$, we have (1) $\forall x$.if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x$.if $\neg\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

To prove $consistency(H, R\{z' \mapsto R(y)\}, C)$, we chose m arbitrarily. (3) Assuming $\textbf{null}(*m) \in C$. By using (1), we have $\textbf{const}(*m) \in C$. Then assuming $H(R(m))$ is defined, we have $H(R(m)) = null$ from (1). Because we have $z' \notin \textbf{Dom}(H) \cup \textbf{Dom}(R) \cup fv(C)$, we have $m \neq z'$, then we have $H(R\{z' \mapsto R(y)\}(m)) = H(R(m)) = null$. (4) Assuming $\neg\textbf{null}(*m) \in C$. By using (2), we have $\textbf{const}(*m) \in C$. Then assuming $H(R(m))$ is defined, we have $H(R(m)) \neq null$ from (2). Because we have $z' \notin \textbf{Dom}(H) \cup \textbf{Dom}(R) \cup fv(C)$, we have $m \neq z'$, then we have $H(R\{z' \mapsto R(y)\}(m)) = H(R(m)) \neq null$.

Therefore, $consistency(H, R\{z' \mapsto R(y)\}, C)$ holds.

- Case: $\langle H, R, \textbf{ifnull } (*y) \textbf{ then } s_1 \textbf{ else } s_2, n, C \rangle \xrightarrow{\textbf{null}(*y)} \langle H, R, s_1, n, C \rangle$ where $H(R(y)) = null$ and $\textbf{const}(*y) \notin C$

  Obviously, $consistency(H, R, C)$ holds from assumption.

- Case: $\langle H, R, \textbf{ifnull } (*y) \textbf{ then } s_1 \textbf{ else } s_2, n, C \rangle \xrightarrow{\neg\textbf{null}(*y)} \langle H, R, s_2, n, C \rangle$ where $H(R(y)) \neq null$ and $\textbf{const}(*y) \notin C$

  Obviously, $consistency(H, R, C)$ holds from assumption.

- Case: $\langle H, R, \textbf{ifnull } (*y) \textbf{ then } s_1 \textbf{ else } s_2, n, C \rangle \xrightarrow{\textbf{null}(*y)} \langle H, R, s_1, n, C \cup \textbf{null}(*y) \rangle$ where $H(R(y)) = null$ and $\textbf{const}(*y) \in C$

  We need to prove $consistency(H, R, C \cup \textbf{null}(*y))$. From assumption $consistency(H, R, C)$, we have (1) $\forall x.$if $\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) = null$ and (2) $\forall x.$if $\neg\textbf{null}(*x) \in C$, then $\textbf{const}(*x) \in C$ and if $H(R(x))$ is defined then $H(R(x)) \neq null$.

  To prove $consistency(H, R, C \cup \textbf{null}(*y))$, we chose z arbitrarily. (3) Assuming $\textbf{null}(*z) \in C \cup \textbf{null}(*y)$. This implies $\textbf{null}(*z) \in C$. By using (1), we have $\textbf{const}(*z) \in C$. This implies $\textbf{const}(*z) \in C \cup \textbf{null}(*y)$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) = null$ from (1). (4) Assuming $\neg\textbf{null}(*z) \in C \cup \textbf{null}(*y)$. This implies $\neg\textbf{null}(*z) \in C$. By using (2), we have $\textbf{const}(*z) \in C$. This implies $\textbf{const}(*z) \in C \cup \textbf{null}(*y)$. Assuming $H(R(z))$ is defined, then we have $H(R(z)) \neq null$ from (2).

  Therefore, $consistency(H, R, C \cup \textbf{null}(*y))$ holds.

$\square$

Proof of Lemma 2.2: By induction on the derivation of $\langle H, R, s, n, C \rangle \xrightarrow{\rho} \langle H', R', s', n', C' \rangle$.

- Case: $\langle H, R, \textbf{const}(*x)s, n, C \rangle \rightarrow \langle H, R, s; \textbf{endconst}(*x), n, C \cup \{\textbf{const}(*x)\} \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \textbf{const}(*x)s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \textbf{const}(*x)s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we get $\Theta; \Gamma \vdash s : P''$ and $\textbf{const}(*x)P'' \leq P$ for some P''. By subtyping, we have $P''; \textbf{endconst}(*x) \leq Q$ and $\langle P, C \rangle \implies \langle Q, C \cup \{\textbf{const}(*x)\} \rangle$ for some Q.

  we need to find P' and C' s.t. $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P'$, $OK_n(P', C')$, $\langle P, C' \rangle \implies \langle P', C' \rangle$ and $consistency(H, R, C')$. Taking Q as P' and $C \cup \{\textbf{const}(*x)\}$ as C'. Therefore $\langle P, C \rangle \rightarrow \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold from Lemma 4.1 and Lemma 4.2. From $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P''; \textbf{endconst}(*x)$, $P''; \textbf{endconst}(*x) \leq Q$ and T-Sub, $\Theta; \Gamma \vdash s; \textbf{endconst}(*x) : P'$ holds.

- Case: $\langle H, R, \mathbf{endconst}(*x), n, C \rangle \to \langle H, R, \mathbf{skip}, n, C' \rangle$ where $C' = filter(C, *x)$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{endconst}(*x), n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \mathbf{endconst}(*x) : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we get $\Theta; \Gamma \vdash \mathbf{endconst}(*x) : \mathbf{endconst}(*x)$ and $\mathbf{endconst}(*x) \le P$. By subtyping , we get $0 \le Q$ and $\langle P, C \rangle \to \langle Q, C \rangle$ for some Q.

  we need to find P' and C' s.t. $\Theta; \Gamma \vdash \mathbf{skip} : P'$, $OK_n(P', C')$, $\langle P, C \rangle \implies P', C' \rangle$ and $consistency(H, R, C')$. Taking Q as P' and C as C', then $\langle P, C \rangle \to \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold from Lemma 4.1 and Lemma 4.2 . From T-SKIP, T-SUB and $0 \le Q$, then $\Theta; \Gamma \vdash \mathbf{skip} : P'$ holds.

- Case: $\langle H, R, \mathbf{free}(x) , n, C \rangle \xrightarrow{\mathbf{free}} \langle H', R, \mathbf{skip}, n + 1, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{free}(x) , n, C \rangle : \langle P, C \rangle$, we have $OK_n(P, C)$, $consistency(H, R, C)$ and $\Theta; \Gamma \vdash \mathbf{free}(x) : P$. From inversion of the typing rules, we have $\Theta; \Gamma \vdash \mathbf{free}(x) : \mathbf{free}$ and $\mathbf{free} \le P$. By the subtyping, we have $\langle P, F \rangle \xrightarrow{\mathbf{free}} \langle Q, C \rangle$ and $\mathbf{0} \le Q$ for some Q.

  We need to find P' and C' such that $\langle P, C \rangle \xrightarrow{\mathbf{free}} \langle P', C' \rangle$, $\Theta; \Gamma \vdash \mathbf{skip} : P'$, and $OK_{n+1}(P', C')$. Take Q as P' and C as C'. Then, $\langle P, C \rangle \xrightarrow{\mathbf{free}} \langle P', C' \rangle$ holds, and $OK_{n+1}(P', C')$ holds from Lemma 4.1. We also have $\Theta; \Gamma \vdash \mathbf{skip} : P'$ from T-SKIP, $\mathbf{0} \le Q$ and T-SUB.

- Case: $\langle H, R, \mathbf{let} \ x = \mathbf{malloc}() \ \mathbf{in} \ s, n, C \rangle \xrightarrow{\mathbf{malloc}} \langle H', R', [x'/x]s, n - 1, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{let} \ x = \mathbf{malloc}() \ \mathbf{in} \ s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \mathbf{let} \ x = \mathbf{malloc}() \ \mathbf{in} \ s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. By the inversion of typing rules, we have $\Theta; \Gamma, x \vdash s : P''$ and $\mathbf{malloc}; (x)P'' \le P$ for some P''. By subtyping, we get $\langle P, C \rangle \xrightarrow{\mathbf{malloc}} \langle Q, F \rangle$ and $[x'/x]P'' \le Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma, x' \vdash [x'/x]s : P'$, $\langle P, C \rangle \xrightarrow{\mathbf{malloc}} \langle P', C' \rangle$, $consistency(H', R', C')$ and $OK_{n-1}(P', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \xrightarrow{\mathbf{malloc}} \langle P', C' \rangle$ holds, and then $OK_{n-1}(P', C')$ and $consistency(H', R', C')$ hold by Lemma 4.1 and Lemma 4.2. From $\Theta; \Gamma, x \vdash s : P''$ and $\mathbf{malloc}; (x)P'' \le P$, we have $\Theta; \Gamma, x'' \vdash [x''/x]s : [x''/x]P''$ and $\mathbf{malloc}; (x)P'' \le P$, and then by the definition of subtyping we have $[x''/x]P'' \le Q'$ for some Q'. Therefore, we get $\Theta; \Gamma, x'' \vdash [x''/x]s : Q'$. Take x'' as x' and Q' as P', then $\Theta; \Gamma, x' \vdash [x'/x]s : P'$ holds.

- Case: $\langle H, R, \mathbf{skip}; s, n, C \rangle \to \langle H, R, s, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{skip}; s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \mathbf{skip}; s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of the typing rules, we get $\Theta; \Gamma \vdash s : P''$ and $0; P'' \le P$. From the definition of subtyping, we have $\langle P, C \rangle \implies \langle Q, C \rangle$ and $P'' \le Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma \vdash s : P'$ and $\langle P, C \rangle \to \langle P', C' \rangle$ and $OK_n(P', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \implies \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$ hold. We also have $\Theta; \Gamma \vdash s : P'$ from T-SUB, $\Gamma \vdash s : P''$ and $P'' \le Q$.

- Case: $\langle H, R, *x \leftarrow y, n, C \rangle \to \langle H', R, \mathbf{skip}, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, *x \leftarrow y, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash *x \leftarrow y : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $0 \le P$.

We need to find P' and C' such that $\Theta; \Gamma \vdash \mathbf{skip} : P'$, $\langle P, C \rangle \Longrightarrow \langle P', C' \rangle$ and $OK_n(P', C')$. Take P as P' and C as C'. Then $\langle P, C \rangle \Longrightarrow \langle P', C' \rangle$ holds, and then $OK_n(P', C')$ and $consistency(H', R, C')$ hold from Lemma 4.1 and Lemma 4.2. We also have $\Theta; \Gamma \vdash \mathbf{skip} : P'$ from T-SKIP, $0 \leq P$ and T-SUB.

- Case: $\langle H, R, \mathbf{let}\ x = y\ \mathbf{in}\ s, n, C \rangle \to \langle H, R', [x'/x]s, n, C \rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{let}\ x = y\ \mathbf{in}\ s, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma, y \vdash \mathbf{let}\ x = y\ \mathbf{in}\ s : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta; \Gamma, x, y \vdash s : P''$ and $\mathbf{let}\ x = y\ \mathbf{in}\ P'' \leq P$ for some P''. By subtying, we have $\langle P, C \rangle \to \langle Q, C \rangle$ and $[x'/x]P'' \leq Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma, x', y \vdash [x'/x]s : P'$, $\langle P, C \rangle \to \langle P', C' \rangle$, $OK_n(P', C')$ and $consistency(H, R', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \Longrightarrow \langle P', C' \rangle$ and $OK_n(P', C')$ hold. From $\Theta; \Gamma, x, y \vdash s : P''$ and $\mathbf{let}\ x = y\ \mathbf{in}\ P'' \leq P$, we have $\Theta; \Gamma, x'', y \vdash [x''/x]s : [x''/x]P''$ and $\mathbf{let}\ x'' = y\ \mathbf{in}\ [x''/x]P'' \leq P$, and then by subtying we have $[x''/x]P'' \leq Q'$ for some Q'. Therefore, we have $\Theta; \Gamma, x'', y \vdash [x''/x]s : Q'$. Take x'' as x' and Q' as P', then $\Theta; \Gamma, x', y \vdash [x'/x]s : P'$ holds.

- Case: $\langle H, R, \mathbf{let}\ x = \mathbf{null}\ \mathbf{in}\ \ s, n \rangle \to \langle H, R', [x'/x]s, n \rangle$

  Similar to the above.

- Case: $\langle H, R, \mathbf{let}\ x = *y\ \mathbf{in}\ \ s, n \rangle \to \langle H, R', [x'/x]s, n \rangle$

  Similar to the above.

- Case: $\langle H, R, \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2, n, C \rangle \xrightarrow{\mathbf{null}(*x)} \langle H, R, s_1, n, C \rangle$ if $H(R(x)) = \mathbf{null}$ and $\mathbf{const}(*x) \notin C$

  From assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta; \Gamma \vdash s_1 : P_1$, $\Theta; \Gamma \vdash s_2 : P_2$ and $(*x)(P_1, P_2) \leq P$. According to the rule Tr-NotConst1 and $\mathbf{const}(*x) \notin C$, we have $\langle (*x)(P_1, P_2) \rangle \xrightarrow{\mathbf{null}(*x)} \langle P_1, C \rangle$, and then by definition of subtyping, we get $\langle P, C \rangle \xrightarrow{\mathbf{null}(*x)} \langle Q, C \rangle$ and $P_1 \leq Q$ for some Q.

  We need to find P' and C' such that $\Theta; \Gamma \vdash s_1 : P'$, $\langle P, C \rangle \xrightarrow{\mathbf{null}(*x)} \langle P', C' \rangle$ and $OK_n(P', C')$. Take Q as P' and C as C'. Then $\langle P, C \rangle \xrightarrow{\mathbf{null}(*x)} \langle P', C' \rangle$ and $OK_n(P', C')$ hold. We also have $\Theta; \Gamma \vdash s_1 : P'$ from T-SUB, $\Theta; \Gamma \vdash s_1 : P_1$ and $P_1 \leq Q$.

- Case: $\langle H, R, \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2, n, C \rangle \xrightarrow{\neg\mathbf{null}(*x)} \langle H, R, s_1, n, C \rangle$ if $H(R(x)) \neq \mathbf{null}$ and $\mathbf{const}(*x) \notin C$

  Similar to the above.

- Case: $\langle H, R, \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2, n, C \rangle \xrightarrow{\mathbf{null}(*x)} \langle H, R, s_1, n, C' \rangle$ if $H(R(x)) = \mathbf{null}$, $\mathbf{const}(*x) \in C$ and $C' = C \cup \{\mathbf{null}(*x)\}$

  From assumption $\Theta; \Gamma \vdash \langle H, R, \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2, n, C \rangle : \langle P, C \rangle$, we have $\Theta; \Gamma \vdash \mathbf{ifnull}\ (*x)\ \mathbf{then}\ s_1\ \mathbf{else}\ \ s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. From the inversion of typing rules, we have $\Theta; \Gamma \vdash s_1 : P_1$, $\Theta; \Gamma \vdash s_2 : P_2$ and $(*x)(P_1, P_2) \leq P$. According to rule Tr-NNullNotIn1, $\mathbf{const}(*x) \in C$ and $C' = C \cup \mathbf{null}(*x)$, we have $\langle (*x)(P_1, P_2) \rangle \xrightarrow{\mathbf{null}(*x)} \langle P_1, C \cup$

23

null$(*x)\rangle$, and then by the definition of subtyping, we get $\langle P, C\rangle \xrightarrow{\textbf{null}(*x)} \langle Q, C \cup \{\textbf{null}(*x)\}\rangle$ and $P_1 \leq Q$ for some Q.

We need to find P' and C' such that $\Theta; \Gamma \vdash s_1 : P'$, $\langle P, C\rangle \xrightarrow{\textbf{null}(*x)} \langle P', C'\rangle$, $OK_n(P', C')$ and $consistency(H, R, C')$. Take Q as P' and $C \cup \{\textbf{null}(*x)\}$ as C'. Then $\langle P, C\rangle \xrightarrow{\textbf{null}(*x)} \langle P', c'\rangle$ holds, and then $OK_n(P', C')$ and $consistency(H, R, C')$hold by Lemma 4.1 and Lemma 4.2. We also have $\Theta; \Gamma \vdash s_1 : P'$ from T-SUB, $\Theta; \Gamma \vdash s_1 : P_1$ and $P_1 \leq Q$.

- Case: $\langle H, R, \textbf{ifnull } (*x) \textbf{ then } s_1 \textbf{ else } s_2, n, C\rangle \xrightarrow{\neg\textbf{null}(*x)} \langle H, R, s_2, n, C'\rangle$ if $H(R(x)) \neq \textbf{null}$, $\textbf{const}(*x) \in C$ and $C' = C \cup \{\neg\textbf{null}(*x)\}$

  Similar to the above proof.

- Case: $\langle H, R, s_1; s_2, n, C\rangle \rightarrow \langle H', R', s_1'; s_2, n', C'\rangle$

  From the assumption $\Theta; \Gamma \vdash \langle H, R, s_1; s_2, n, C\rangle : \langle P, C\rangle$, we have $\Theta; \Gamma \vdash s_1; s_2 : P$, $OK_n(P, C)$ and $consistency(H, R, C)$. By inversion of typing rules, we have $\Theta; \Gamma \vdash s_1 : P_1$, $\Theta; \Gamma \vdash s_2 : P_2$ and $P_1; P_2 \leq P$ for some P_1 and P_2.

  By IH on $\langle H, R, s_1, n, C\rangle$ with derivation $\langle H, R, s_1, n, C\rangle \xrightarrow{\rho} \langle H', R', s_1', n', C'\rangle$, we have $\exists P_1', C_1'$ s.t. $\Theta; \Gamma \vdash \langle H', R', s_1', n', C'\rangle : \langle P_1', C_1'\rangle$ and $\langle P_1, C\rangle \xrightarrow{\rho} \langle P_1', C_1'\rangle$.

  By subtyping we have $\langle P, C\rangle \xrightarrow{\rho} \langle Q, C_1'\rangle$ and $P_1'; P_2 \leq Q$ for some Q.

  We need to find P' and C' s.t. $\langle P, C\rangle \xrightarrow{\rho} \langle P', C'\rangle$, $OK_n(P', C')$ and $\Theta; \Gamma \vdash s_1'; s_2 : P'$. Take Q as P' and C_1' as C', $\langle P, C\rangle \xrightarrow{\rho} \langle P', C'\rangle$ and $OK_n(P', C')$ hold. By T-Sub, $\Theta; \Gamma \vdash s_1'; s_2 : P_1'; P_2$ and $P_1'; P_2 \leq Q$, we have $\Theta; \Gamma \vdash s_1'; s_2 : P'$ holds.

  $\square$

We write $\langle H, R, s, n, C\rangle \xrightarrow{\rho}$ if there is a transition $\xrightarrow{\rho}$ from $\langle H, R, s, n, C\rangle$.

Lemma 4.3. *If* $\Theta \vdash \langle H, R, s, n, C\rangle : \langle P, C\rangle$ *and* $\langle H, R, s, n, C\rangle \xRightarrow{\rho}$ *and* $\rho \in \{\textbf{malloc}, \textbf{free}, \textbf{null}(*x), \neg\textbf{null}(*x)\}$, *then there exists* P' *and* C' *such that* $\langle P, C\rangle \xRightarrow{\rho} \langle P', C'\rangle$.

Proof. Induction on the derivation of $\Theta; \Gamma \vdash \langle H, R, s, n, C\rangle : \langle P, C\rangle$. $\square$

Proof of Lemma 2.3:
By contradiction. Assume $\langle H, R, s, n, C\rangle \xrightarrow{\rho} \textbf{OutOfMemory}$. Then, n is 0 and $\rho = \textbf{malloc}$ from SEM-OUTOFMEM. From the assumption we have $\Theta; \Gamma \vdash s : P$ and $OK_0(P, C)$. From Lemma 4.3, there exists P' and C' such that $\langle P, C\rangle \xRightarrow{\textbf{malloc}} \langle P', C'\rangle$. However, this contradicts $OK_0(P, C)$.

$\square$

Proof of Theorem 2.1:
We have $\Theta; \emptyset \vdash s : P, \vdash D : \Theta$, $OK_n(P, C)$ and $consistency(H, R, C)$.

Suppose that there exists σ such that $\langle \emptyset, \emptyset, s, n, C\rangle \xrightarrow{\sigma} \langle H', R', s', n', C'\rangle \xrightarrow{\rho} \textbf{OutOfMemory}$. Then, $n' = 0$ and $\rho = \textbf{malloc}$. From Lemma 2.2, there exists P' and C' such that $\Theta; \Gamma' \vdash s' : P'$, $\langle P, C\rangle \xRightarrow{\sigma} \langle P', C'\rangle$, and $OK_0(P', C')$; hence $\langle H', R', s', 0\rangle \xrightarrow{\textbf{malloc}}$. However, this contradicts Lemma 2.3.
